

Dear Sir/Madam,

I'm a software engineer with programming skills primarily in C++ and python. I have several years of experience in large-scale application development and maintenance using C++ technologies on backend systems. I have a good understanding of performance critical application development with a strong object-oriented software development procedure and design patterns. I'm familiar with following technologies:

- C++, Python, Java, JavaScript
- STL, Boost, Qt
- MS-SQL, MySql, SQLite
- Api design(rest, web-services, open api specification)
- Test driven development

Currently, I am working as a Software Engineer at BMW Car IT in Ulm. Here I am developing "Speech" middleware component for BMW cars, which enables voice control for navigation and entertainment unit. Before, I was in France, working as a Software Engineer at Amadeus SAS. There I was part of a development team, building a message switching component for a distributed system enabling different applications to communicate with each other.

I believe my experience, skills, education, and interest would be a good fit for the position. I have attached my resume for your consideration. I hope, I would be a very good candidate for your company.

Best regards

Asish Kumar Biswas
